Anders Henriksen

Agentic AI & Automation | AI Adoption & Enablement
Kongens Lyngby (Copenhagen) | anhenr.dev@gmail.com | linkedin.com/in/andershenriksen

Profile

Gets agentic AI out of pilots and into daily use. At Capital Four, a credit investment manager, runs the AI use-case pipeline, tracks adoption and value, built a network of AI champions, and teaches colleagues to use Claude and Copilot well. Builds much of it hands-on: AI agents that cut the DevOps team's tasks from three days to one, coding agents used by several tech teams, and MCP servers to internal systems. Master's in Artificial Intelligence from DTU, experience from asset management, banking and pharma R&D, and a focus on evaluation, cost and governance.

Skills

AI & Machine Learning: Agentic AI, AI Agents, MCP Servers, Claude & Claude Code, GitHub Copilot, Microsoft 365 Copilot, Copilot Studio, RAG (Vector Database, Semantic Search), LLM Evaluation (Test Sets, LLM-as-Judge), LLM Observability (Langfuse), LLM Gateways, Anthropic & OpenAI APIs, NLP, Document Intelligence (OCR), ML & Deep Learning, MLOps
Programming & Systems: Python, FastAPI, Pydantic, pytest, SQL, Git, GitHub Enterprise, Azure DevOps, CI/CD, Docker, Kubernetes, Microsoft Azure, AWS, Databricks, MLflow, SharePoint, Power Automate, Power Apps
Financial Domain Expertise: Credit Risk, IFRS9 (PD, LGD, EAD, ECL), Treasury, Asset Management & Investment Workflows, Portfolio Analytics, Financial Modeling, ISAE3402
Business & Collaboration: AI Adoption & Change Management, AI Use-Case Pipeline & Business Cases, Adoption & Value KPIs, AI Champion Networks, Training & Workshops, Stakeholder Management up to C-level, Technical Mentorship

Experience

Senior Data Analyst, Capital Four **Jun 2026 – Present**

- Run the firm's AI use-case pipeline at a credit investment manager with more than EUR 15bn under management: ideas scored on value and feasibility, business cases, and adoption tracked on dashboards, in user surveys and by usage and cost per team via an LLM gateway. Built a network of AI champions across teams.
- Teach all technical colleagues to get the most from Claude, then hand the building to their teams, and offer AI training to anyone in the firm through workshops, one-to-one sessions and guides: chatbots versus agents, levels of automation, where to check output, which model to use when. Rolled out Microsoft 365 Copilot and set up SharePoint as a knowledge base.
- Built the DevOps team's agentic setup, where Copilot and Claude Code work from GitHub issues to implement tasks and write change reports for colleagues and auditors: tasks that took about three days now finish within one, and several tech teams use it. Gave the agents an API and MCP server for a GitHub-backed task board, made 78% cheaper than the plain API through an agent's A/B tests. Building a digital colleague in Claude (knowledge base, skills, commands; 6 users) tested on fixed questions, and designed a standard for team agents.
- Built AI and automation for business colleagues: a one-click MS Teams button (Power Automate, SQL stored procedures) that switches user access in the portfolio management system, used by 78 people instead of a manual task done 5-10 times a day; a Power Apps HR app removing 20+ manual steps per joiner or leaver; Claude and Copilot Studio agents connected to internal systems and Power Automate flows; and helped build the firm's RAG solution with semantic search over a vector database.
- Leading everyone at the company with a code repository from Azure DevOps to GitHub Enterprise, coordinated through their managers, and setting the CI/CD, coding and agentic standards. Earlier moved the team from Trello, Confluence, SharePoint, network drives and SSMS to Git as the single source of truth (ISAE3402 audits now need one page), and led a security audit of the company's 77 repositories that shaped the security setup for GitHub Enterprise.

Data Analyst (Tech Lead) in Group Treasury, Danske Bank **Mar 2026 – May 2026**

- Drove adoption of AI tools and modern software practice across the department as acting tech lead, upskilling 45+ non-technical colleagues and embedding the tools in their day-to-day processes.
- Architected a closed-loop agent in GitHub Copilot that migrates legacy SAS code to Python, fetching test data dynamically, verifying output parity and flagging data drift. Used by 45 colleagues on an estimated 300+ scripts in scope, it sped up the migration and cut onboarding and migration costs.
- Wrote a Python runner that navigates a legacy application's menus and extracts data an employee collected by hand each month over several hours. It now takes two minutes, with no mistakes.

Data Scientist in Portfolio Intelligence, Danske Bank **Apr 2025 – Mar 2026**

- Moved the team to software engineering best practice: wrote a custom Git guide, introduced unit and end-to-end testing, and taught GitHub Copilot and modern Python.
- Co-owned the bank-wide rebuild of Danske Bank's IFRS9 Expected Credit Loss model (PD, LGD, EAD, ECL) in pure Python instead of PySpark: hands-on in building, re-estimating, validating and backtesting, and proved it through shadow production and regression testing until the numbers matched.
- Ported the model to AWS ECS with multithreading for its I/O-bound workload: 80% faster processing.

Data Scientist (Student Helper) in R&D, Novo Nordisk **Dec 2021 – Oct 2024**

- Upskilled the team in Git and deployment practices, improving reliability and cutting errors by 30%.
- Worked on a MATLAB digital twin of type 1 diabetes, simulating the effect of new insulin analogues.
- Profiled a US team's Python version of the model and rewrote its slow parts in Cython: 60 times faster.
- Built reproducible Python workflows extracting insights from large data volumes for cross-team decisions.

Co-founder, Absis ApS **2020 – 2021**

- Built an automated OCR pipeline in Python extracting data from financial documents (document intelligence).

Projects

Nordic Bank Report RAG github.com/AndersHenriksen-dev/nordic-bank-report-rag

- Answers questions over 12 Nordic bank annual reports with page citations. Hybrid search with a reranker reaches recall@6 0.94 (0.77 for keyword search) on a 44-question test set, at USD 0.001 per question.

Self-Hosted LLM Observability with Langfuse

- Set up a self-hosted Langfuse instance, routed own LLM application data through it and monitored it over time, with an LLM-as-judge scoring the traces.

Education

MSc Human-Centered Artificial Intelligence, DTU, GPA 11.3 / 12.0 **2024**

- **Relevant Coursework:** Machine Learning Operations, Time Series Analysis, High-Performance Computing, System Integration, Computer Vision, User-Experience in Data Science
- **Master's Thesis (Novo Nordisk, grade 12):** Forecast next-day vaso-occlusive crises in sickle cell disease from questionnaires, biometrics, weather and location data (AUC 0.98), built production-ready with CI/CD.

BSc Artificial Intelligence and Data, DTU, GPA 10.7 / 12.0 **2022**

- **Relevant Coursework:** Deep Learning, Machine Learning and Data Mining, Reinforcement Learning, Algorithms & Data Structures, Software Engineering, Probability & Statistics, Database Engineering
- **Bachelor's Project (grade 12):** CycleGAN for removing field-strength bias in an MRI-based Alzheimer's disease classification model.

Courses: PMI Agile and Predictive Project Management (2026); Coursera Financial Markets (2025).
